Disclaimer

This report has been prepared for the Town of Wasaga Beach and is solely intended for their purpose and use. Any copying, distribution, or use by others without the express written consent of Ainley & Associates Limited is strictly prohibited. Ainley & Associates Limited accepts no responsibility for damages suffered by any third party as a result of any unauthorized use of the information contained herein.

1. INTRODUCTION

1.1 Preamble and Purpose

Ainley & Associates Limited (Ainley) was retained by the Town of Wasaga Beach to undertake an update of the 2013 Road Needs Study, including conducting an inventory of road conditions; assessing and prioritizing short-term and medium-term road improvement needs; providing updated costing associated with the recommended improvements; as well as updating the GIS mapping to reflect the findings.

Through the completion of this update, the Town intends to develop a cost-effective strategy for the management of their road assets.

1.2 Previous Studies

At the request and direction of the Town, the 2013 Road Needs Study developed by C.C. Tatham and Associates Limited (CCTA), was reviewed and used as a basis for this Study update, including the methodology, inventory database, as well as reporting statistics and methods.

We acknowledge the past contributions of CCTA and the assistance of Town Staff in the preparation of this Study update.

2. ROAD INVENTORY AND DATA COLLECTION

2.1 Road Inventory Methodology

The Ministry of Transportation of Ontario (MTO) *Inventory Manual for Municipal Roads* outlines the procedures for collection of roadside data. The road inventory and assessment completed for this Road Needs Study update utilized the appraisal form established in the 2013 Study, which was developed in part from those procedures. A copy of the form can be found in Appendix A.

There are a number of key elements that are used to characterize a road system, including but not limited to road section, reference number, length, class, environment, geometric deficiencies, cross-section elements, distress, and ride comfort rating.

The 2013 database and GIS mapping of the road network was provided by the Town and used as a starting point to maintain consistency in road sections, reference numbers, data collection, and reporting.

A road tour was completed with the Town's Manager of Operations during the months of May and June of 2018 to confirm previously recorded data, obtain new data, and to

complete a visual inspection of the current road conditions in order to provide ratings for pavement distress and ride comfort.

A total of 206.9 km (centerline) of roads, split into 1087 road sections, were inventoried.

This Study update includes approximately 12.3 km of roads that were not included in the previous Road Needs Study (2013). These roads primarily consist of roads that have been constructed to service new development, which have now been assumed by the Town.

It should be noted that roads that are private, unassumed, unopened, or considered to be laneways or access roads have not been included.

While various components of the road inventory are discussed in detail hereafter, the complete road inventory can be found in Appendix B.

2.2 Road Classification Statistics

2.2.1 Roadside Environment

The roadside environment refers to physical and surrounding characteristics, including cross-section elements as well as natural and social variables. The identification of the roadside environment is an important consideration as improvement costs can be dependent upon the characteristics of this environment.

Road environment can be categorized as rural, semi-urban, or urban based on the surrounding land use as well as cross-section elements and drainage. Typically, rural environments are defined as those areas where road cross-sections include shoulders and open ditches and the frontage consists of minimal or lower density development (<50% of frontage). Urban environments are defined as those areas where road cross-sections include curb, gutter, and storm sewers with a higher level of development.

Table 1, below, presents a summary of the Town's road inventory by environment. The majority of the Town's roads (65%) are considered to be of semi-urban environment, meaning that the cross-section does not consist of curb and gutter, but they are located in areas with a development density that exceeds 50% of the frontage. One quarter (25%) of the Town's roads are considered to be urban and 10% are rural.

Table 1: Road Inventory Summary by Environment

Road Environment	Road Sections		Road Length	
	Number	% of Total	Km	% of Total
Rural	40	4%	20.1	10%
Semi-Urban	762	70%	135.0	65%
Urban	285	26%	51.8	25%
Total	1087	100%	206.9	100%

2.2.2 Road Function

Roads are typically further classified by their intended function as a local, collector, or arterial roadway. The road function classifications in the original Study were based on the Town's Official Plan and, in particular, defines the classifications as follows:

- **Local Roads** – Intended to provide access to abutting properties and to discourage through traffic. These roads typically have lower travel speeds and road capacity as a result of the number of driveways and access points.
- **Collector Roads** – Intended to collect traffic from local roads and convey it to arterial roads. As a result, direct access to abutting properties is expected to be minimized as much as possible.
- **Arterial Roads** – Intended to carry heavy volumes of traffic and are designed to encourage traffic to use these routes rather than local or collector roads. In order to ensure effective traffic flow, direct access to abutting properties is not typically permitted.

Table 2, below, presents a summary of the Town's road inventory by road function. As can be expected, almost three quarters (73%) of the Town's roads, by length, are designated as local roads, with only 15% and 11% designated as collector and arterial, respectively.

Table 2: Road Inventory Summary by Road Function

Road Function	Road Sections		Road Length	
	Number	% of Total	Km	% of Total
Local	823	76%	151.5	73%
Collector	131	12%	32.0	15%
Arterial	133	12%	23.4	11%
Total	108	100%	206.9	100%

2.2.3 Traffic Volumes and Maintenance Classifications

Average Annual Daily Traffic (AADT)

Traffic volumes, represented as Average Annual Daily Traffic (AADT), and posted speed limits are used to establish the maintenance classification for each road section, in accordance with *Ontario Regulation 239/02, Minimum Maintenance Standards for Municipal Highways*. Class 1 roads generally have higher traffic volumes and posted speeds whereas Class 6 roads generally have low traffic volumes (AADT < 50) and posted speeds.

The road classification is used as one of the factors in identification of proposed improvements and development of the pavement management strategy for the entire road network. For example, Class 6 roads are not subject to Ontario Regulation

239/02, meaning that there is not a minimum maintenance standard and; therefore, may not warrant the same prioritization as higher-class roads.

Current (2018) AADT values were established for each road section based on:

- Traffic count data from the previous Road Need Study (2013);
- Updated traffic count data provided by the Town;
- Traffic count data from the 2017 Transportation Study Update; and
- Traffic data for various developments.

In order to forecast AADT's for the 5, 10, and 20-year planning horizons, available growth rates from the aforementioned background studies were utilized for several road sections. For any road sections where growth rates were not available, the rates were kept consistent with those from the 2013 Study, as follows:

- 0% annual growth from low volume roads (i.e. those with AADT < 50);
- 1% annual growth rate for local roads; and
- 2% annual growth rate for collector and arterial roads.

A summary of the Town's road network based on AADT values for the current, 5, 10, and 20-year planning horizons is provided in Table 3, below.

Table 3: Road Inventory Summary by AADT Range

AADT Range	2018		2023		2028		2038	
	Road Length km	%						
<50	5.5	3%	3.8	2%	3.8	2%	3.7	2%
50 ≤ AADT < 500	126.1	61%	123.6	60%	121.5	59%	117.1	57%
500 ≤ AADT < 1000	21.4	10%	23.1	11%	23.5	11%	24.7	12%
1000 ≤ AADT < 5000	31.4	15%	33.8	16%	32.4	16%	33.5	16%
> 5000	22.6	11%	22.6	11%	25.8	12%	27.9	13%
Total	206.9	100%	206.9	100%	206.9	100%	206.9	100%

As expected, the majority of the Town's road network serves low volumes of traffic, representing local residential users. By 2038, approximately 28.0 km of road, or 13% of the road network will have traffic volumes in excess of 5,000. For planning purposes, a review of the volume to capacity ratio (v/c) for those roads with a projected AADT in excess of 5,000 was completed, using assumed capacities of 400 vehicles per hour per lane (vphpl) for local roads, 600 vphpl for collector roads, and 800 vphpl for arterial roads. The results are as follows:

- 45th Street South (v/c ≤ 71%);
- Golf Course Road (v/c ≤ 56%);

- Main Street (v/c ≤ 68%);
- Sunnidale Road South (v/c ≤ 59%);
- Theme Park Drive (v/c ≤ 59%); and
- Zoo Park Road (v/c ≤ 43%).

Generally, capacity deficiencies are flagged once the v/c ratio reaches 90% of the road's capacity. Only two roads were noted to reach this threshold:

- Mosley Street (between 45th Street and 71st Street) is projected to reach a v/c of 83% in the 5-year horizon, 95% in the 10-year horizon, and 117% in the 20-year horizon;
- River Road West (from Golf Course Road to Bell Park Road) is projected to reach a v/c ratio of 77% in the 5-year horizon, 85% in the 10-year horizon, and 103% in the 20-year horizon.

It is recommended that the Town continue with selecting various road segments for their annual traffic count program to monitor traffic volumes. With the recent build out of commercial development in the downtown area, we would recommend that a good candidate for traffic counts would be Stonebridge Boulevard, particularly near the intersections of River Road East, Wally Drive, and Main Street.

Maintenance Classification

Based on the established AADT (2018) values and posted speeds, the following table summarizes the Town's road inventory by Maintenance Class:

Table 4: Road Inventory by Maintenance Class

Maintenance Class	Road Sections		Road Length	
	Number	% of Total	Km	% of Total
Class 1	0	0%	0	0%
Class 2	66	6%	6.6	3%
Class 3	94	9%	24.7	12%
Class 4	198	18%	50.1	24%
Class 5	674	62%	119.9	58%
Class 6	55	5%	5.5	3%
Total	1087	100%	206.9	100%

2.2.4 Road Surface

Road surfaces can be comprised of various materials, which have different life expectancies and maintenance requirements both by nature of their design as well as other factors such as volume of traffic. The timing and costs associated with improvements for the various types of road surfaces must therefore be considered.

Table 5, overleaf, presents a summary of the Town's road inventory by road surface type. The Town's roads are almost exclusively made up of asphalt surface types (98%).

Table 5: Road Inventory by Road Surface

Road Surface Type	Road Sections		Road Length	
	Number	% of Total	Km	% of Total
Sand	4	0%	0.9	0%
Gravel	12	1%	2.3	1%
Surface Treated	0	0%	0.0	0%
Asphalt	1071	98%	203.8	98%
Total	1087	100%	206.9	100%

2.2.5 Drainage

Table 6, below, presents a summary of the Town's road inventory by drainage type. The statistics generally coincide with the road function classification in that approximately one quarter (24%) of the Town's roads have storm sewers with the remainder having either open ditches or no formal drainage. This is not surprising given the Town's geological trait of having free draining sandy soils.

Table 6: Road Inventory by Drainage Type

Drainage Type	Road Sections		Road Length	
	Number	% of Total	Km	% of Total
No Drainage	500	46%	86.4	42%
Open Ditch	303	28%	68.5	33%
Storm Sewer	275	25%	50.2	24%
Storm Sewer & Ditch	9	1%	1.8	1%
Total	1087	100%	206.9	100%

2.3 Road Assessment

2.3.1 Pavement Distress

All road sections were reviewed and any pavement distress deficiencies noted based on presence and extent of the distress types noted in Table 7, overleaf.

Table 7: Pavement Distress Types*

Surface Related Distress	Base Related Distress
▪ Raveling and loss of surface aggregate	▪ Disintegration, debonding, potholes
▪ Flushing or bleeding	▪ Wheel track rutting
▪ Rippling and shoving	▪ Patching
▪ Crack sealing deficiencies	▪ Alligator cracking
▪ Block cracking	
▪ Transverse or longitudinal cracking	

*Based on the 2013 Road Needs Study.

Severity and density weightings were assigned for each distress type noted on each road section, which was then used to calculate the overall Pavement Condition Index (PCI) discussed in section 2.3.3.

2.3.2 Ride Comfort Rating

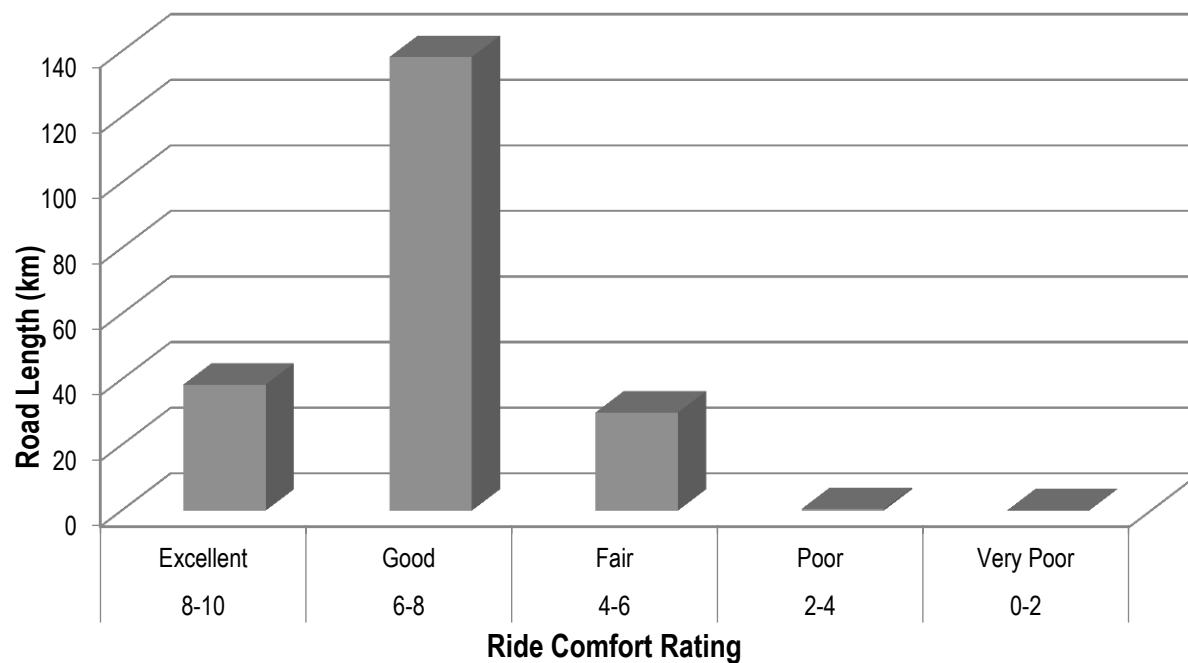

Another component that is taken into consideration when calculating the overall PCI of a road section is the Ride Comfort Rating (RCR). This is a subjective measure of how smooth or comfortable the ride feels when the road is driven at the posted speed limit.

Table 8, below, presents a summary of the Town's road inventory based on the assigned RCR.

Table 8: Road Inventory by Ride Comfort Rating

Ride Comfort Rating	Road Sections		Road Length		
	Number	% of Total	Km	% of Total	
8 < RCR ≤ 10	Excellent	191	18%	39.8	19%
6 < RCR ≤ 8	Good	774	71%	138.4	67%
4 < RCR ≤ 6	Fair	115	11%	28.1	14%
2 < RCR ≤ 4	Poor	6	1%	0.6	0%
0 < RCR ≤ 2	Very Poor	1	0%	0.1	0%
Total	1087	100%	206.9	100%	

When considering the length of road, the average RCR within the Town's road system is 7.6, meaning that overall the system is considered to have a good riding surface, as illustrated in Figure 1.

Figure 1: Ride Comfort Rating by Road Length

2.3.3 Pavement Condition Index (PCI)

Each road section that has an asphalt surface receives a Pavement Condition Index (PCI) rating, which is a numerical value from 0 to 100 that is calculated based on the assigned RCR and the observed pavement distresses. Each type of distress carries its own weighted value, with base related distresses typically weighted more heavily than surface related distresses. The severity and density of each distress also carries a weighting that is factored into the calculation. The higher the PCI rating, the better the road condition.

Table 9, below, presents a summary of the Town's road inventory based on PCI rating.

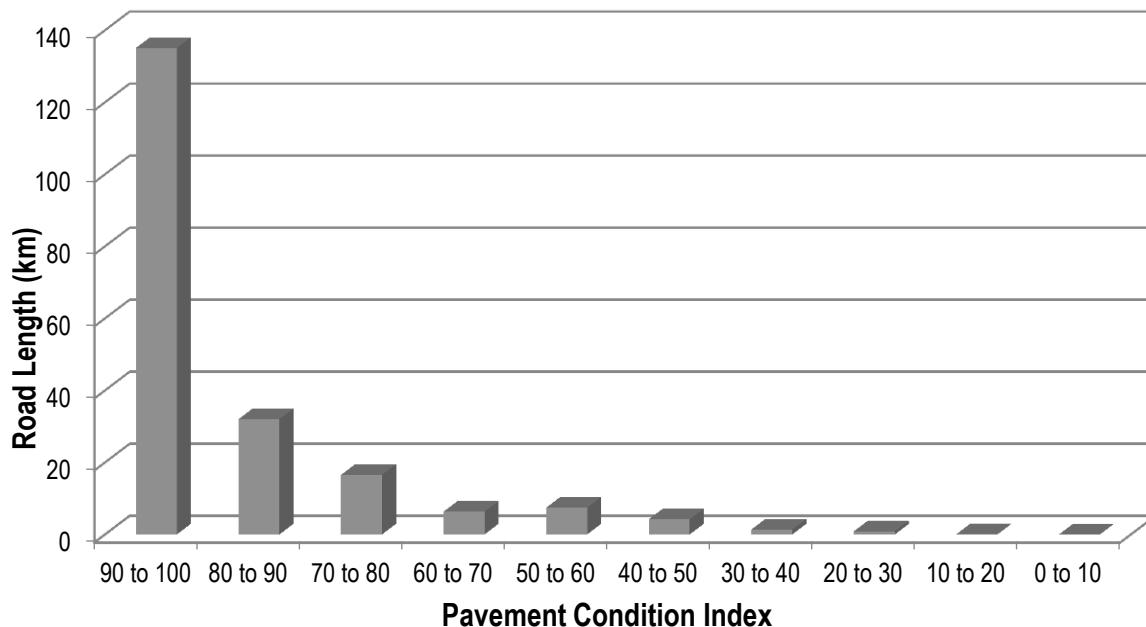

Table 9: Road Inventory by PCI Rating

PCI Rating	Road Sections		Road Length	
	Number	% of Total	Km	% of Total
90 < PCI ≤ 100	747	70%	137.0	67%
80 < PCI ≤ 90	165	15%	31.9	16%
70 < PCI ≤ 80	96	9%	15.4	8%
60 < PCI ≤ 70	25	2%	5.6	3%
50 < PCI ≤ 60	20	2%	7.4	4%
40 < PCI ≤ 50	13	1%	4.2	2%

Table 9: Road Inventory by PCI Rating (Continued)

PCI Rating	Road Sections		Road Length	
	Number	% of Total	Km	% of Total
30 < PCI ≤ 40	3	0%	1.4	1%
20 < PCI ≤ 30	1	0%	0.9	0%
10 < PCI ≤ 20	1	0%	0.1	0%
0 < PCI ≤ 10	0	0%	0.0	0%
Total	1071	100%	203.8	100%

Over 80% of the Town's roads received a PCI rating in excess of 80. The average PCI within the Town's road system is 87 (by road length) and 90 (by road section), meaning that overall the system is considered to be in good to excellent condition, as illustrated in Figure 2.

Figure 2: Pavement Condition Index by Road Length

3. IDENTIFICATION OF NEEDS & IMPROVEMENTS

3.1 Types of Improvements

PCI ratings, as calculated for each road section, are used to identify any needed improvements. There are multiple types of improvements, the application of which can vary depending upon PIC rating as well as surface type, environment, and other factors. These types of improvements are discussed further below.

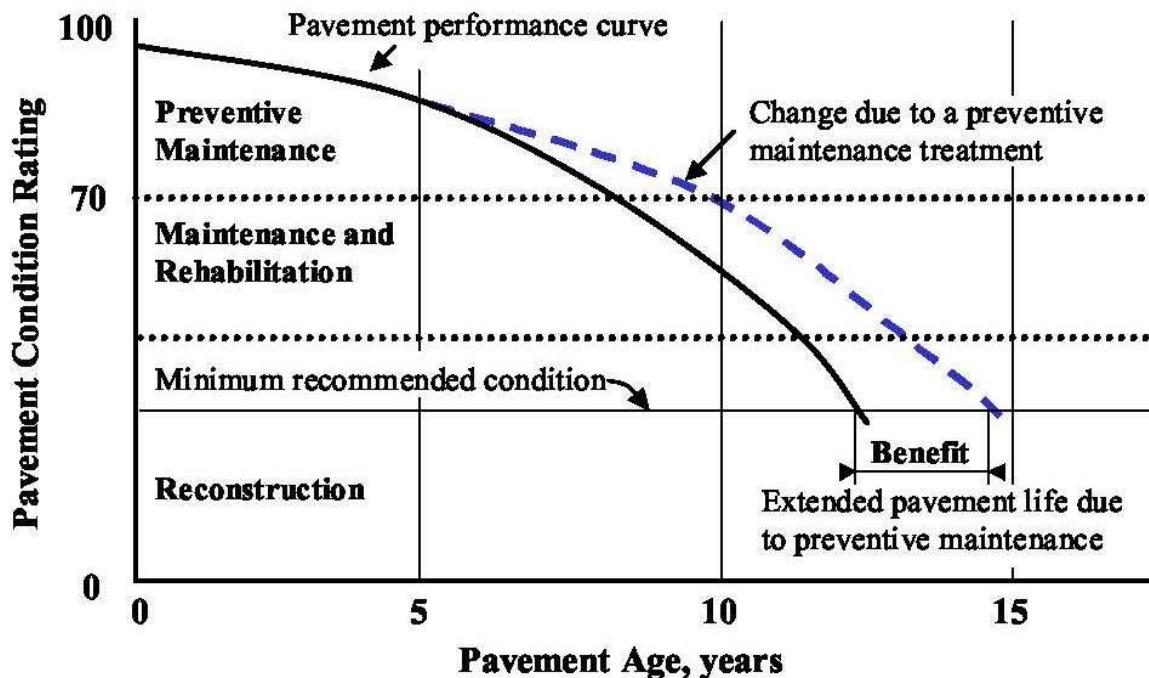

3.1.1 Gravel and Sand Roads

Approximately 1.5% of the Town's roads have sand or gravel surface. It is assumed that gravel roads will be kept in acceptable condition through regular maintenance. Typically, traffic volumes are monitored and when they exceed approximately 800 vehicles per day it is recommended that the surface be upgraded to either surface treatment or asphalt. None of the Town's sand and gravel road sections have AADTs that are even half of this; therefore, as in the original Study, only sand/gravel maintenance is recommended. No further improvements are deemed to be warranted.

3.1.2 Asphalt Roads

The remaining 98.5% of the Town's roads consist of an asphalt surface. To maintain consistency with the original Study from 2013, the types of road improvements for any given section of road have been broken down into the following categories:

- **Do Nothing** – this recommendation is provided when a road is in excellent condition and no maintenance or improvement is required.
- **Routine Maintenance** – this recommendation is provided when roads are generally in good condition but could benefit from some routine maintenance intended to preserve or extend the life expectancy. This category may include routine maintenance in the form of localized pot hole repairs, crack sealing, etc.
- **Preventative Maintenance** – this recommendation is provided when roads are still in fair to good condition, but the noted deficiencies may be more prevalent or extensive. If the surface is still within the realm of economic maintenance, the application of preventative maintenance measures can be used to delay the need for more major improvement work. Figure 3 shows the benefit that can be realized through completion of preventative maintenance at the right point in the lifecycle, as taken from *Timely Preventive Maintenance for Municipal Roads – A Primer*, published by the Federation of Canadian Municipalities and National Research Council.

Figure 3: Benefits of Preventive Maintenance for Extended Pavement Life

- **Improvements** – this recommendation is provided once a road has generally surpassed the timing for economic maintenance applications and major improvement work is required. This is further broken down into:
 - a) Rehabilitation, which would include more extensive work such as resurfacing or “shave and pave” operations in order to further protect the road base; or
 - b) Reconstruction, which would include full removal and replacement of the road structure to address major structural issues and re-establish a proper pavement system.

3.2 Benchmark Costs

The benchmark costs developed in the original 2013 Study were reviewed and updated to reflect changes in market price as determined using recent road construction tenders. Updated unit costs can be found in Appendix C. These benchmark costs were applied to the various road section improvements in order to develop a cost estimate for planning and budgetary purposes. However, it should be noted that actual costs can vary as a result of other factors that are difficult to estimate, including but not limited to construction timing, weather, market supply and demand as well as the size of individual projects.

3.3 Time of Needs

As per the 2013 Study, timing of road needs has been tied to predefined thresholds or triggers, broken down by PCI rating and road function, as illustrated in Table 10.

Table 10: Road Needs Thresholds

Pavement Condition	PCI Range			Road Need	Time of Need
	Arterial	Collector	Local		
Excellent	90 – 100	85 – 100	80 – 100	Do Nothing	Adequate
Good	80 – 89	75 – 84	70 – 79	Routine Maintenance	6 – 10 years
Fair	70 – 79	65 – 74	60 – 69	Preventative Maintenance	1 – 5 years
Deficient	0 – 69	0 – 64	0 – 59	Improvements	Now

We note that these thresholds have been based on typical industry values and experience; however, they can be modified at the Town's discretion if they desire alternative triggers for their pavement management system.

3.4 Summary of Needs, Improvements, and Costs

Table 11, below, presents a summary of the Town's road inventory by road need and improvement costs. A listing of the needs and improvements by road section is included in Appendix D. Mapping of the road system, colour coded by pavement condition and recommended improvements, are included in Appendix E.

Table 11: Road Needs and Improvement Costs

Road Need/Improvement	Road Sections	Road Length		Improvement Cost
		Km	% of Total	
Do Nothing	885	164.3	79%	\$0
Sand/Gravel Maintenance	16	3.2	1%	\$28,300
Routine Maintenance	90	14.6	7%	\$364,900
Preventative Maintenance	50	9.4	5%	\$533,000
Improve – Resurface	26	5.8	3%	\$823,300
Improve – Rehabilitate	19	9.6	5%	\$2,836,000
Improve – Reconstruct	1	0.1	0%	\$48,000
Total	1087	206.9	100%	\$4,633,500

Based on the above, only 15.5 km of the Town's 207.3 km of road network (approximately 8%) require improvements, which is down from 21.8 km or 11% in 2013. This is a result of the Town undertaking some of the previously recommended improvements over the course of the last five years.

3.5 Generalized Improvement Costs

The total improvement costs for the system were used to develop generalized average costing for each improvement type for planning and budgeting purposes, as summarized in Table 12, below. We caution that although the costing is inclusive of contingency and engineering factors, it does not necessarily account for other road segment specifics.

Table 12: General Road Improvement Cost/Km

Road Improvement	Average Cost/Km
Gravel Maintenance	\$13,000
Routine Maintenance	\$26,000
Preventative Maintenance	\$57,000
Improve – Resurface	\$142,000
Improve – Rehabilitate	\$297,000
Improve – Reconstruct (rural)	\$640,000

We note that the average cost identified for the reconstruction of a rural section is based solely on one road segment within the Town's system. Further, as there are no urban sections identified for reconstruction, there is no average cost based on the existing system.

Therefore, our recommendations for generalized benchmark costing would be as follows, based on a standard two-lane cross-section:

Reconstruction (rural) – \$900,000/km

Reconstruction (urban, without underground servicing improvements) – \$1,500,000/km

New construction (urban, with underground municipal servicing) – \$3,400,000/km

4. PRIORITIES AND RECOMMENDATIONS

In order to establish priority for the identified needs and improvements, one standard industry practice is to assign a Priority Guide Number (PGN), which uses an empirical formula developed by MTO that considers the condition assessment, but also takes into account the road function (i.e. AADT) and the cost of improvements. The higher the PGN, the higher the priority of the improvement relative to its condition; the volume of traffic it is serving; and the cost of improving the section; thereby providing more of a value-based assessment to ensure that the Town is receiving the most service or benefit for the costs incurred. As a result, the PGN does not necessarily prioritize the roads with the worst condition first, but rather tends to generally favour cost effective maintenance alternatives in order to preserve those roads that are in good condition,

followed by poor condition arterials, collectors, and then local roads. By focusing on maintenance activities in the short-term, this approach can provide the Town with some time to budget for more expensive reconstruction work.

The road inventory included in Appendix D provides the Priority Guide Numbers for each road section. Table 13, below, presents a summary of the top twenty-five road sections by Priority Guide Number, which has been referred to as the “Best-First” approach. Under this scenario, the Town would undertake the improvements in order of priority as listed below until their annual maintenance budget has been fully expended and would then carry over remaining work to subsequent years.

Table 13: Priority Road Sections – Using “Best First” Approach

Rank	PGN	Section No.	Road Section	From	To	Need/ Improvement
1	188	8982	Mosley Street	53 rd Street South	52 nd Street South	Preventative Maintenance
2	186	8953	Mosley Street	50 th Street South	50 th Street North	Preventative Maintenance
3	183	9145	Mosley Street	64 th Street North	63 rd Street North	Routine Maintenance
4	177	9186	Mosley Street	67 th Street North	66 th Street north	Preventative Maintenance
5	177	9214	Mosley Street	70 th Street North	69 th Street North	Routine Maintenance
6	176	8944	Mosley Street	49 th Street South	49 th Street North	Preventative Maintenance
7	175	8964	Mosley Street	51 st Street South	51 st Street North	Preventative Maintenance
8	173	9169	Mosley Street	66 th Street North	65 th Street North	Preventative Maintenance
9	167	9156	Mosley Street	65 th Street North	64 th Street North	Preventative Maintenance
10	164	8932	Mosley Street	47 th Street North	46 th Street North	Preventative Maintenance
11	164	8974	Mosley Street	52 nd Street South	51 st Street South	Preventative Maintenance
12	163	8213	River Road West	Oxbow Park Drive	Brillinger Drive	Preventative Maintenance
13	161	9202	Mosley Street	68 th Street North	67 th Street North	Preventative Maintenance

Table 13: Priority Road Sections – Using “Best First” Approach (Continued)

Rank	PGN	Section No.	Road Section	From	To	Need/ Improvement
14	159	9011	Mosley Street	56 th Street South	55 th Street South	Preventative Maintenance
15	158	8934	Mosley Street	48 th Street North	47 th Street North	Routine Maintenance
16	158	8937	Mosley Street	48 th Street South	48 th Street North	Routine Maintenance
17	157	7287	Mosley Street	426 m W of 6 th Street N	319 m W of 6 th Street N	Routine Maintenance
18	156	7268	Mosley Street	319 m W of 6 th Street N	235 m W of 6 th Street N	Routine Maintenance
19	156	9030	Mosley Street	57 th Street South	56 th Street South	Preventative Maintenance
20	155	8959	Mosley Street	51 st Street North	50 th Street South	Preventative Maintenance
21	154	7293	Mosley Street	10 th Street South	426 m W of 6 th Street N	Routine Maintenance

24	147	8775	Mosley Street	41 st Street North	40 th Street North	Routine Maintenance
25	145	9003	Mosley Street	55 th Street South	54 th Street South	Preventative Maintenance

It should be noted that this listing is strictly based on the empirical PGN formula and does not take into account other considerations such as geographic location or the Town's capital program. As such, a more holistic review is recommended to determine how best to allocate annual funds.

For example, 24 out of 25 or 96% of the above noted road sections are Mosley Street. Further, 19 out of 24 or 79% are road sections located between 45th Street and Beachwood Road, which is already included in the Town's capital program for urbanization in the near future. Therefore, the Town may choose to forego any routine or preventative maintenance on these road sections as the expense may be considered a “throw away” cost.

An alternative approach that is sometimes used is referred to as the “Worst-First” approach. In this scenario, the road sections that are in the worst condition regardless of class or function, requiring reconstruction, rehabilitation, or resurfacing, are prioritized.

Table 14 presents a summary of the top twenty-five road sections using the “Worst-First” approach.

While this provides a listing of the road sections with the poorest condition, once again, a more holistic review is recommended to ensure that other factors are considered.

For example, 7 out of 25 or 28% of the below noted road sections are road ends that service traffic volumes of less than 200 vehicles per day. As such, the Town may decide that a lower level of service is acceptable and forego any improvements until conditions deteriorate further; thereby allowing prioritization of other roads. Further, rather than simply following the listing order, the Town may wish to group road sections that are located in the same general area to develop more of a resurfacing/rehabilitation program. For example, 48th Street South, 49th Street South, Aster Drive, Lee Street, and Marie Street are all located within a quadrant on the southeast corner of Mosley Street and 45th Street. It may be beneficial to group these streets into one large rehabilitation/resurfacing contract.

Lastly, the Town may wish to apportion the annual budget through a combination of maintenance needs as well as large scale rehabilitation/resurfacing improvements.

Table 14: Priority Road Sections – Using “Worst-First” Approach

Rank	PGN	Section No.	Road Section	From	To	Need/ Improvement
1	1	22522	11 th Street South	End of Road	Mosley Street	Reconstruct
2	1	8620	Fleming Avenue	37 th Street North	36 th Street North	Rehabilitate
3	1	9111	Shore Lane	Shore Lane	Shore Lane	Resurface
4	1	9074	Crocus Drive	Orchid Street	49 th Street South	Resurface
5	1	9045	50 th Street South	End of Road	Mosley Street	Rehabilitate
6	1	9110	Shore Lane	72 nd Street North	Simcoe Street	Resurface
7	1	9006	Andrew Court	End of Road	Sunnidale Road South	Resurface
8	2	9055	49 th Street South	Crocus Drive	Mosley Street	Rehabilitate
9	2	9564	Wedgewood Drive	Blake Court	Martyn Drive	Resurface
10	2	9018	Lee Street	Aster Drive	Queensdale Avenue	Resurface
11	2	7391	Old Mosley Street	14 th Street South	13 th Street S	Rehabilitate

Table 14: Priority Road Sections – Using “Worst-First” Approach (Continued)

Rank	PGN	Section No.	Road Section	From	To	Need/Improvement
12	2	8960	51 st Street North	Mosley Street	Pinecrest Avenue	Rehabilitate
13	2	9039	Aster Drive	48 th Street South	Lilac Street	Resurface
14	2	9102	56 th Street South	End of Road	Mosley Street	Rehabilitate
15	2	9153	54 th Street South	Iris Drive	Mosley Street	Resurface
16	2	8999	Marie Street	End of Road	Queensdale Avenue	Resurface
17	2	9115	Shore Lane	End of Road	74 th Street North	Resurface
18	2	9038	48 th Street South	Aster Drive	Mosley Drive	Resurface
19	2	7358	13 th Street South	Old Mosley Street	Mosley Street	Resurface
20	2	7108	Northgate Road	Savarin Street	Berkely Street	Resurface
21	2	9352	Bay Sands Drive	Highway 26	Bay Sands Drive	Resurface
22	2	9474	Morgan Road	Lamont Creek Drive	Middleton Drive	Resurface
23	2	9571	Wedgewood Drive	End of Road	Blake Court	Rehabilitate
24	2	7047	Longdale Road	End of Road	Golf Course Road	Rehabilitate
25	3	9296	Kelley Crescent	Wasaga Sands Drive	Wasaga Sands Drive	Resurface

5. ADDITIONAL CONSIDERATIONS

In addition to the considerations discussed in the previous section, it is understood and recommended that the Town utilize the information from this study in conjunction with other available asset management data, such as watermain breakage history and closed circuit television footage of sewer conditions, along with exploring opportunities to maximize the available budget through government funding or economies of scale, when developing the final maintenance program.

6. EXCLUSIONS

As required by Ontario Regulation 104/97 made under the Public Transportation and Highway Improvement Act, an inventory and assessment of the Town's vehicular and pedestrian bridges as well as large span ($\geq 3.0\text{m}$) culverts was completed under separate assignment and, as such, has not been included herein.

An inventory and assessment of the Town's minor culverts was not included as part of this assignment. It is understood that the Town intends to complete this inventory and assessment using their own forces and will undertake any necessary remedial action for noted deficiencies in order to ensure the infrastructure is operating in its intended purpose and capacity.

7. CONCLUSION

This study was undertaken to provide the Town with recommendations to be used for the purposes of planning, budgeting, and prioritizing a preventative maintenance program over the next five-year budget cycle. It is understood that final decisions on what work is actually completed may be adjusted by Town Staff, in conjunction with Council, as part of normal operations and as a result of other factors not discussed herein.

It is once again recommended that the study be updated in five years to capture improvements that have been completed and reassess the priority rankings and recommended improvements.
